

**ECOTECOPOOL** was founded in the year 1988 in AUROVILLE in the State of Tamil Nadu, India. We start as a swimming pool builder based on the Italian experience of our CEO. Now days one of the main activities of the company is still to build residential and commercial pool projects all over India.

Mineral water pools are increasing in popularity as a 'spa-like' alternative to traditional salt water pools. Mineral pools: use various blends of minerals like magnesium Chloride instead of or as well as traditional salt are often less salty than traditional pools, with Total Dissolved Solids (TDS) of 3,500 parts per million (ppm) instead of the 5,000 ppm typically required in conventional salt water pools.

*The new alternative for mineral water pool owners running magnesium based systems.*

Magnesium based systems typically use magnesium chloride but alternative minerals include potassium chloride, calcium chloride and others. Mineral Chlor™ is also compatible with traditional sodium chloride.

Introducing Salt Mineral Water Pool.....

Provides protection against germs and bacteria to keep pools beautifully healthy and sparkling clean. Works effectively with magnesium, potassium, and/or calcium chlorides minerals as well as being compatible with traditional sodium chloride pools. Enables mineral water pool owners to low consumptions.

Less hassle. Enables savings on minerals. Ideal for climates where heavy rains can cause pools to overflow frequently, requiring ongoing mineral replenishment.

Designed and manufactured in Australia, the Mineral Water Pool chlorine generator uses two high performing electrolytic cells to generate a sufficient amount of chlorine in mineral water pools.

The critical component of these cells is a Genuine Anode which dramatically improves the performance of the chlorine generator and the life span of the electrode, which in turn enables health-conscious families to enjoy a health spa like experience in their home environment.

Chlorine generators work by passing an electrical charge through water containing minerals as it flows over a series of titanium plates (anodes). The process, called electrolysis, causes a reaction at the surface of the anodes, producing Sodium Hypochlorite (the sanitizing agent commonly used in swimming pools) to kill waterborne germs and bacteria.

This way pools are kept clean and healthy without the hassle and risks associated with having to add liters of disinfectant manually.

Water quality is arguably the most important aspect of any aquatic operation. Clean, clear and healthy water attracts bathers and maintains public safety. Ecoteco Pools boasts a long standing history in water disinfection via electrolysis including mixed oxidants generation as well as on-site sodium hypochlorite generation.

For nearly 20 years, has serviced thousands of satisfied commercial and residential pool owners, making a preferred innovative product distributor. On-site Chlorine Generators & Electrolyses distributed by Ecoteco Pools help to achieve superior water quality while also saving water and energy. All products are a safe, environmentally friendly, cost effective, and maintenance-free alternative to traditional chemical dosing.

With world trusted brands the extensive distribution range is designed to withstand the harshest environmental conditions and meet customer needs in any water application. Fresh water swimming pool owners can now recycle backwash water for in-house irrigation, thanks to our salt-less electrolyses. Contact our experienced engineering team today to discuss your next project. WE are committed to providing "perfect water through a perfected science."

We provide ready-made solutions to form a complete package. These include design, construction, supply and installation of all special components as well as an annual maintenance service contract that will ensure efficient and trouble free running of the entire system.

We are available for any query or information regarding our services and for a quick and detailed estimate of your requirements. Do contact us.
